Criação de endpoints utilizando Aggregate + Ajustes na API

Parcerias para desenvolver a sua carreira

AGENDA

- Ajustes na configuração da aplicação
- Criação de endpoints com Aggregate

Criar novo modelo de dados chamado comments.py dentro da models def create collection comments(mongo client): comments validator = { "\$jsonSchema": { "bsonType": "object", "required": [" id", "name", "email", "movie id", "text", "date"], "properties": { " id": { "bsonType": "objectId", "description": "Chave definida da collection" **}**, "name": { "bsonType": "string", "description": "Nome do usuário",

```
"email": {
  "bsonType": "string",
  "description": "Duração",
},
"movie id": {
  "bsonType": "objectId",
  "description": "Vínculo da collection movie"
"text": {
  "bsonType": "string",
  "description": "Comentário",
```

```
"date": {
              "bsonType": "date",
              "description": "Data do comentário"
  try:
   mongo client.create collection("comments")
  except Exception as e:
   print(e)
 mongo client.command("collMod", "comments", validator=comments validator)
```

```
Atualização da models de movies.py
def create collection movies(mongo client):
 movies validator = {
    "$jsonSchema": {
        "bsonType": "object",
        "required": [
          " id",
          "plot",
          "genres",
          "runtime",
```

```
"cast",
"num mflix comments",
"title",
"fullplot",
"countries",
"released",
"directors",
"rated",
"awards",
"lastupdated",
"year",
"imdb",
"type",
"tomatoes"
```

```
mongo client.create collection("movies")
except Exception as e:
  print(e)
mongo client.command("collMod", "movies", validator=movies validator)
```

```
Atualização do app.py
from src.app import app, mongo client
from src.app.models.comments import create collection comments
from src.app.models.movies import create collection movies
from src.app.routes import routes
from flask.cli import with appcontext
import click
routes (app)
@click.command(name='create collections')
@with appcontext
def call command():
  create collection movies (mongo client)
  create collection comments(mongo client)
app.cli.add command(call command)
```

```
Atualização do init .py da pasta src.app
REMOVER AS SEGUINTES IMPORTAÇÕES
from src.app.models.movies import create collection movies
from src.app.models.cast import create collection cast
REMOVER AS SEGUINTES LINHAS DE CÓDIGO
create collection movies(mongo client)
create collection cast(mongo client)
```

Criação de endpoints com Aggregate

Criação de endpoints com Aggregate

```
Criar arquivo na pasta controller, chamado comments.py e escrever o seguinte código.
from flask import Blueprint
from flask.wrappers import Response
from src.app import mongo client
from bson import json util
comments = Blueprint("comments", name , url prefix="/comments")
@comments.route("/get all", methods = ["GET"])
def get all():
  comments = mongo client.comments.aggregate([
     "$limit": 5
```

Criação de endpoints com Aggregate

```
return Response(
    response=json_util.dumps({'records' : comments}),
    status=200,
    mimetype="application/json"
)
```
